

MONOTHERMAL LAMINATE CONSTITUENT ELEMENTS

AT FIRST GLANCE, THE DESIGN OF THE MONOTHERMAL MAY SEEM OVERLY SIMPLISTIC – BUT IN FACT THESE ARE ALL OF THE ESSENTIAL ELEMENTS. POLYVINYL ACETATE (FUNCTIONING AS A POLYMERIC BINDER) IS THE ONLY OTHER MATERIAL REQUIRED TO CONSTRUCT THE MONOTHERMAL LAMINATE.

ENERGY SHED

RESIDENTIAL APPLICATIONS HOUSE WITH "ENERGY SHED"

MAIN HOUSE

01 – Residential applications might include the construction of a simple ‘energy shed’ to house Monothermal panels in order to capture trapped heat energy before converting it to alternating current usable by the residence.

ENERGY SHED with "STACKED" PANELS

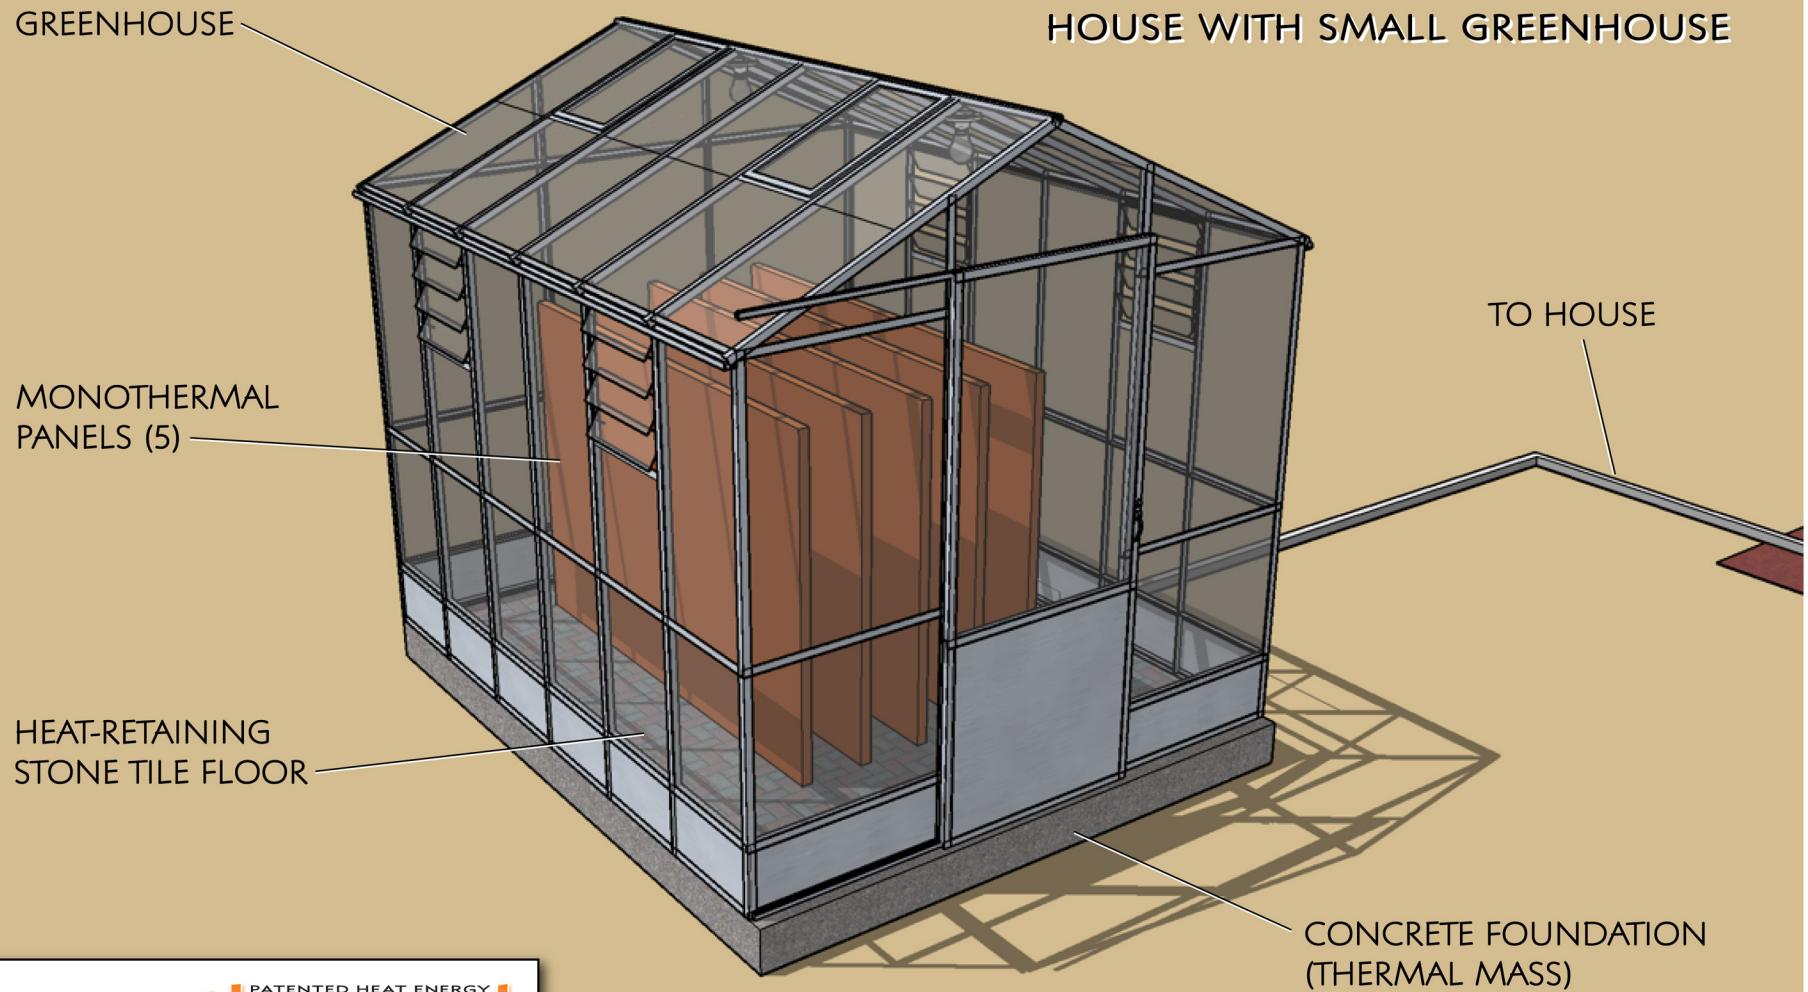

2010 LOVELL PATENTED TECHNOLOGY

03 – Another variation would take advantage of the increased efficiency of the Monothermal material when it's layered or 'stacked.' At an internal temperature of 150°F this array (approx. 40 sq. ft. / panel x 25 = 1000 sq. ft. total) has the potential to return 1000W (1 kW) to the homeowner. At 200°F, this same installation could generate as much as 35,000W (35 kW) of power.

04 – A simple and inexpensive kit greenhouse can also be utilized.

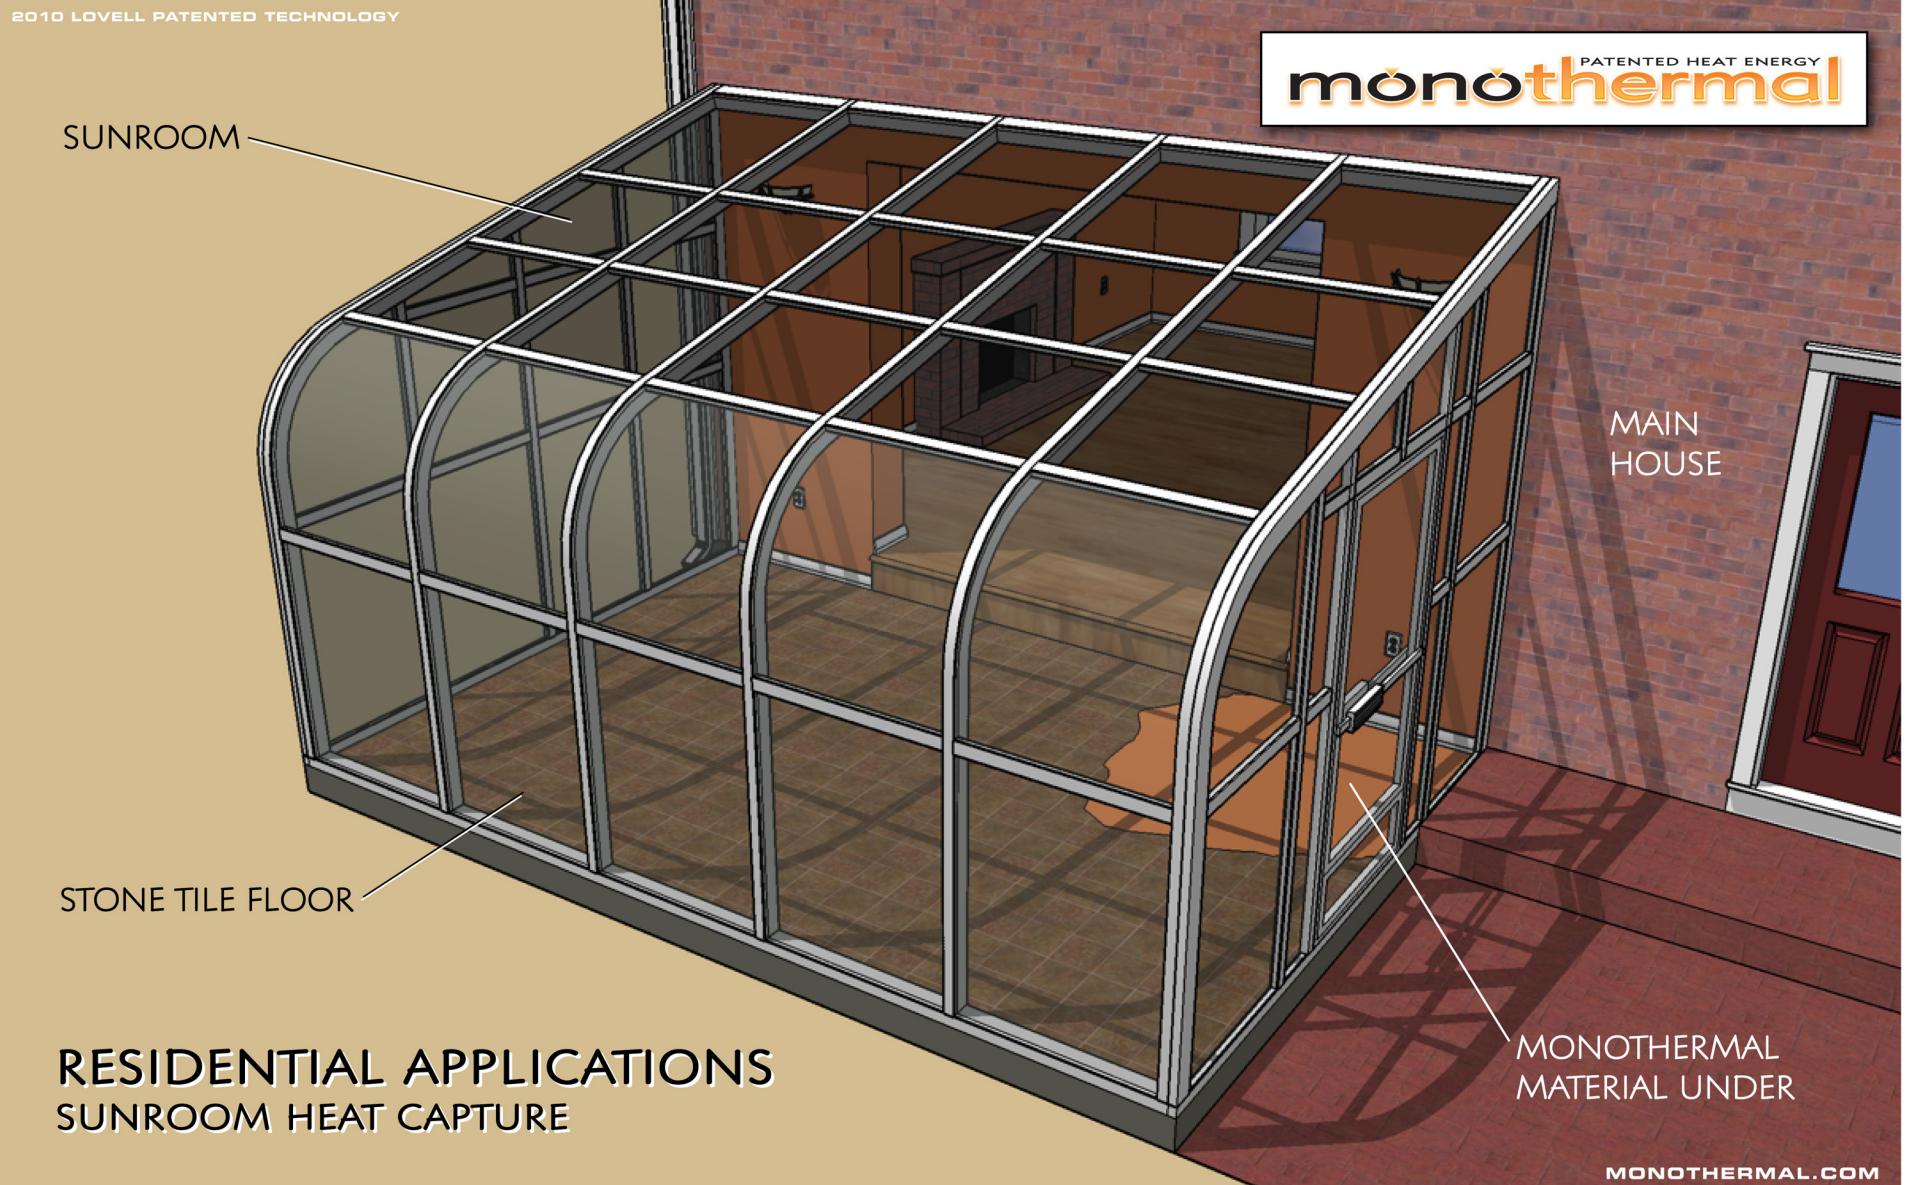

05 – Connection to the main residence, not very different from a typical solar energy conversion installation.

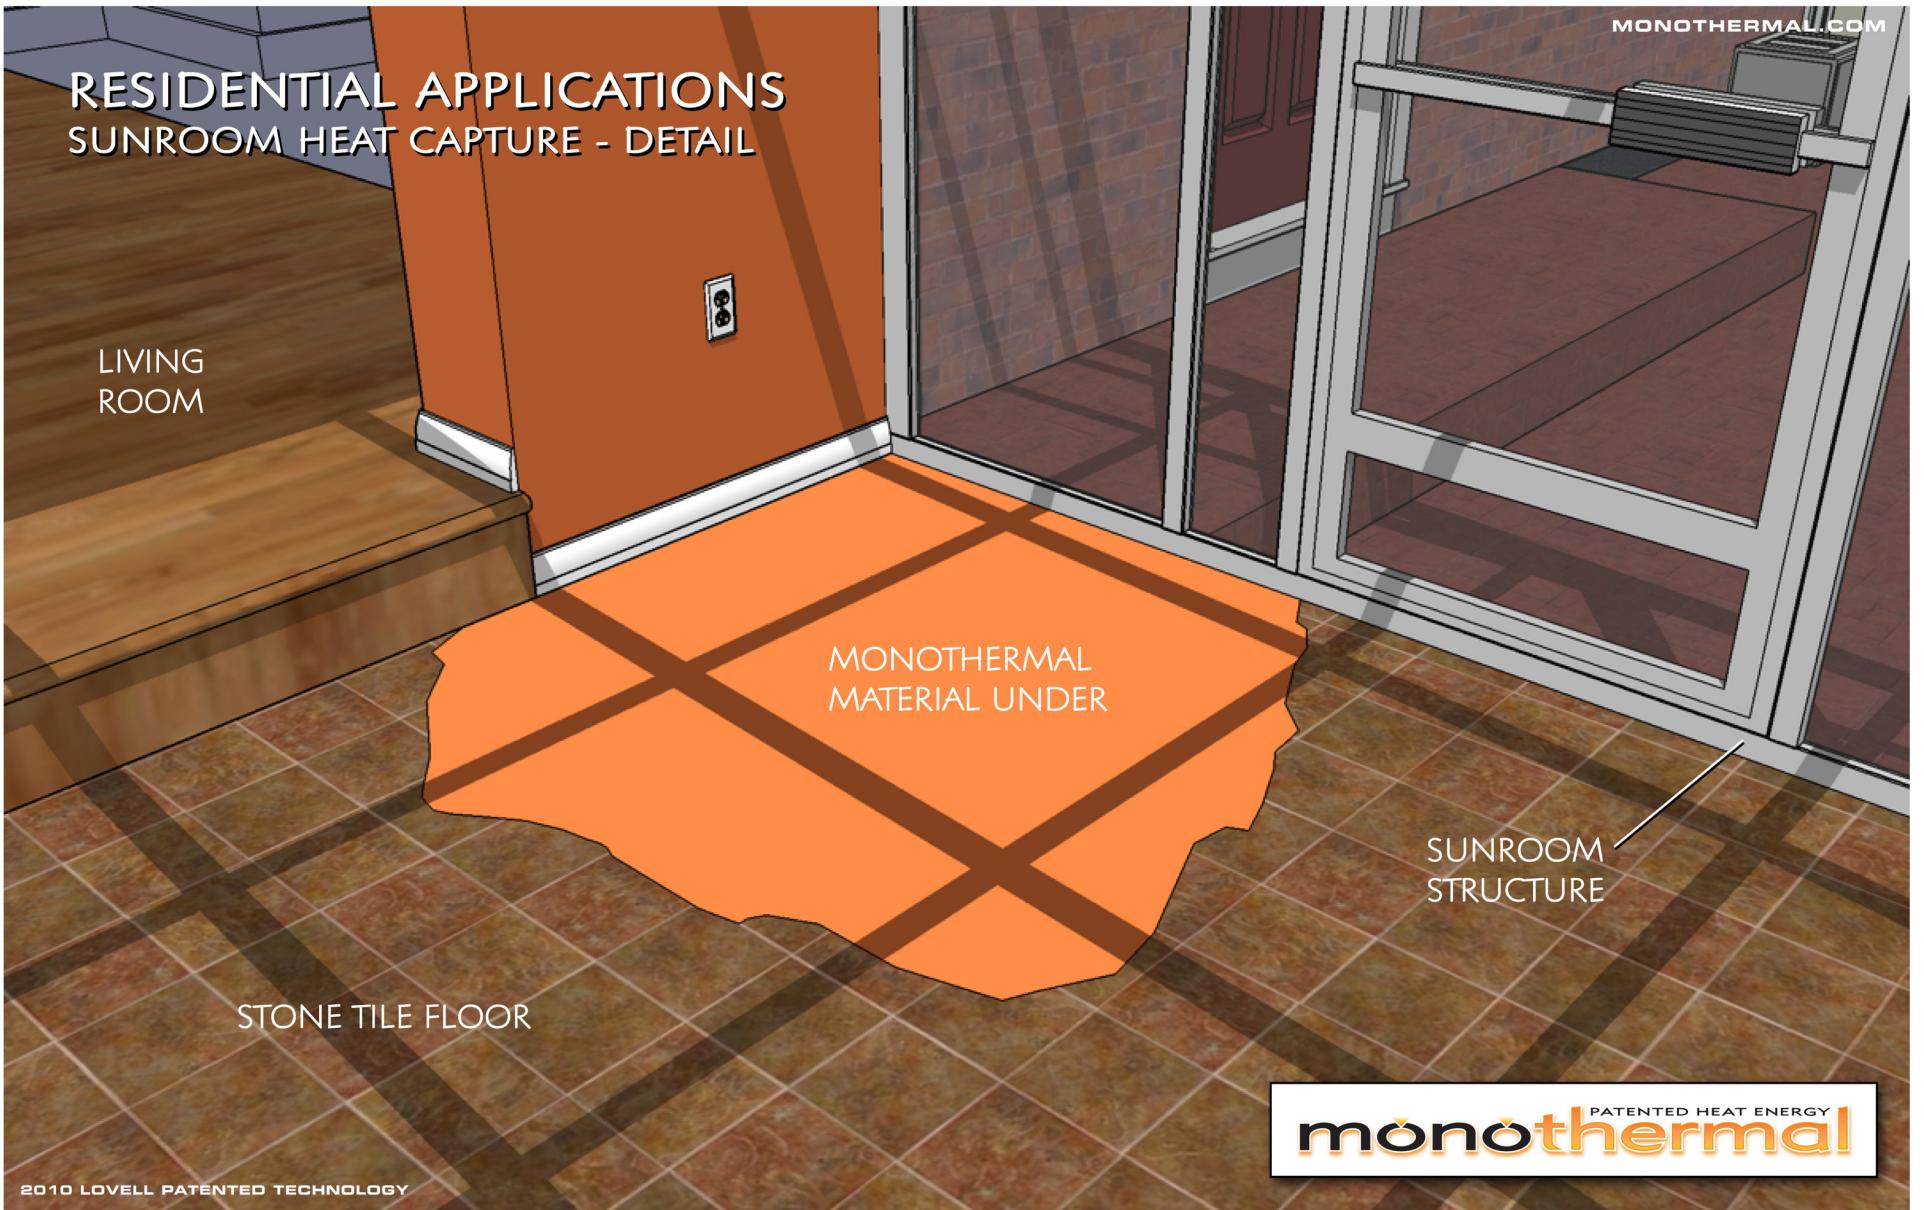

06 – An alternate embodiment showing installation of Monothermal laminate under a thermal mass such as an outdoor patio.

PATENTED HEAT ENERGY
monothermal

07 – Existing sunrooms are ideal environments for conversion to allow installation of the Monothermal.

08 – Sunroom application with installation beneath heat-retaining stone tile flooring.

PATENTED HEAT ENERGY
monothermal

09 – Application to wall structures is also possible in a solar gain environment.

(MONOTHERMAL CAN ALSO BE APPLIED TO CEILINGS TO CAPTURE RISING HEAT)

2010 LOVELL PATENTED TECHNOLOGY

10 – Interior residential application to wall surfaces, capturing both body heat and energy previously lost via the fireplace. Note also the potential of affixing Monothermal material to ceiling surfaces for capture of natural convective heat transfer.

monothermal PATENTED HEAT ENERGY

monothermal PATENTED HEAT ENERGY

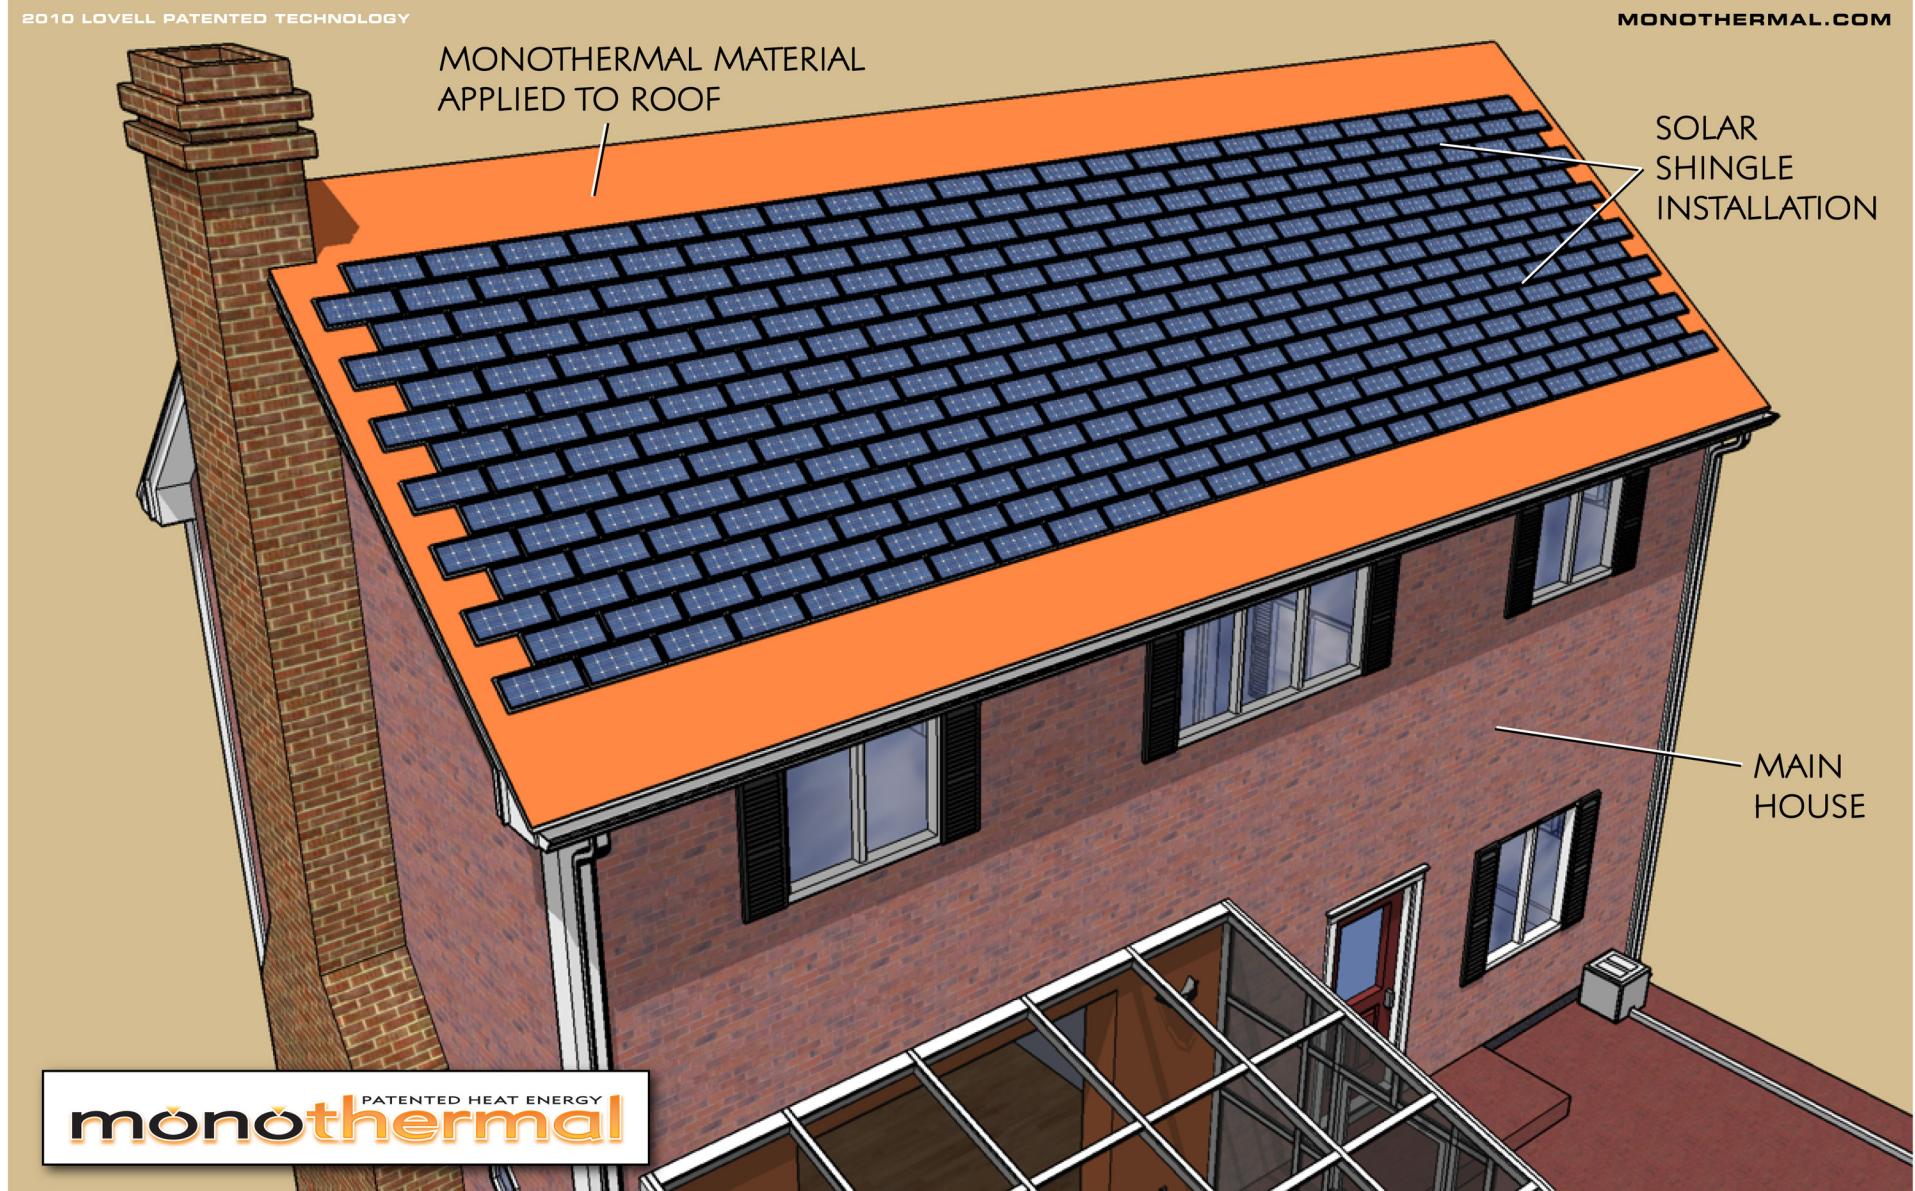

11 – Application to roof surface. Monothermal material will capture heat energy on overcast days and even at night – no daylight necessary. Alternatively, the Monothermal can be installed in unused interior attic space to capitalize on the high temperatures usually present.

12 – Monothermal installation in concert with typical large solar panel array.

2010 LOVELL PATENTED TECHNOLOGY

MONOTHERMAL.COM

13 – Monothermal installation together with new solar shingle application. Both solar panels and newer solar shingles require that a roof be at the proper angle relative to the sun in order to maximize energy gain. Likewise, a home must be sited correctly to take advantage of the sun's path through the sky. The Monothermal has no such limitations.

21 – Both public and private parking lots occupy vast amounts of land resources in the U.S., with national urban coverage estimates of between 2% and 5% of land use*. Literal 'heat islands', they raise surrounding temperatures by several degrees on sunny days – making them a perfect application for the heat energy generation capabilities of the Monothermal.
